The Hows and Whys

Every computer we use today stores and processes data using binary code. This code allows us to communicate with computers and process the instructions we give them. Although we may type our requests using letters and numbers, those requests are then converted to binary code so the computer can understand and process them.

Directions

Using the binary conversion chart (handed out), lightly pencil the binary code for each letter of your name on the paper. Then using the paintbrush and paint, paint over your pencil drawing to create your final version. Use different colors for each letter of your name or the same for all--it's all about being creative!

Materials

- Pencil
- Paper
- Paintbrush
- Watercolor

Finish Early?
Try writing secret messages in binary code & have others decode the messages.
